

LEVELRIDE-LADDER — 26-Week REALISTIC Projection

Start \$4,100 USD - size scales with capital, uncapped (20%-worst-day safety rule) - MNQ, converting to NQ at scale

REALISTIC model: ~60% of worst-case-fee backtest, a genuine LOSING week roughly every 5th week, and red days throughout. Position size keeps climbing as the account grows. Still a projection - real edge persistence over 6 months is the big unknown.

Projected balance — 26 weeks (REALISTIC: red weeks + drawdowns included)

Projected (realistic model): **\$4,100 -> \$47,440** in 26 weeks. Final size: 7 rung x 4 MNQ.

What 'realistic' means here - and the real risks

1) Returns are ~60% of the worst-case-fee backtest with a losing week about every 5th week and red days throughout - much more sober than a best-case run. 2) Position size keeps climbing with the account (no artificial cap) under one rule: the worst simulated day stays under 20% of the balance. At scale, MNQ converts to full NQ (1 NQ = 10 MNQ) for efficiency; MNQ/NQ liquidity easily absorbs this size. 3) THE REAL UNKNOWN is not liquidity - it is whether the edge holds for 6 straight months. Backtests degrade; regimes change; a strategy printing this in sim can flatten in live. 4) Bigger size = bigger real drawdowns in dollars - a 20%-of-account red day at week 20 is tens of thousands. Same % pain, far larger numbers. 5) Weeks 1-3 are DEMO on \$4,100 - zero real risk - to prove live fills match sim before any real money. This sheet is the shape of success IF everything holds, made sober; it is not a promise.
