Projected: **\$4,100 -> \$35,090** in 8 weeks (+\$30,990), through 3->5->7 rungs then 2x size as the account clears each safety threshold.

The take-turns upgrade rule

At each step the bot takes whichever upgrade earns most while keeping the worst simulated day under ~20-30% of the balance. That alternates between adding rungs (smoother) and doubling size (more per trade). Upgrades happen only on your explicit word once the balance clears the threshold.

Config	Backtest \$/wk (worst-case fees)	Worst day	Balance needed
3 rung x 1 MNQ	+\$2,471	-\$1,301	deployed now
5 rung x 1 MNQ	+\$3,566	-\$1,798	\$8,990
7 rung x 1 MNQ	+\$3,959	-\$1,928	\$9,640
7 rung x 2 MNQ	+\$7,918	-\$3,856	\$19,280
7 rung x 3 MNQ	+\$11,877	-\$5,784	\$28,920

Read this before believing the numbers

1) ILLUSTRATION of how compounding + upgrades COULD play out if performance tracks the backtest - not a forecast. 2) Backtest passed: every year green, long+short symmetric, 20,800+ sibling configs positive, outlier-clip positive. NOT yet passed: live-fill reality, hostile-week replay, blind window - which is why weeks 1-3 run on the \$4,100 demo, risking nothing real. 3) A bad stretch (sim worst drawdown -\$2,508 at 3 rungs) on \$4,100 is ~61% - survivable but painful; hence demo validation first. 4) Figures ~80% of worst-case-fee sim; real fees nudge up, market-order slippage could nudge down. The demo weeks measure which.
