

52-WEEK PROJECTION - PER-MARKET CAPS

the PULSE book (impulse->0.618 pullback->2:1 bracket, tick-true validated)
sizes re-checked EVERY SESSION - the moment balance affords a unit, it trades

MARKET	HELD-OUT \$/wk/micro	MICRO CAP	(10% of measured level flow)
Nasdaq	\$481	56	through-vol p25 56 big/min
S&P 500	\$186	135	through-vol p25 135 big/min
Dow	\$75	13	through-vol p25 13 big/min

POLICY B (RECOMMENDED, +1 unit per \$3,000):

52-wk ending \$1,549,476 final target 505u, effective 204 micros after caps

POLICY C (AGGRESSIVE, +1 unit per \$2,000):

52-wk ending \$1,906,052 final target 936u, effective 204 micros after caps

Built from the strategy's REAL validated held-out days (extremes trimmed, chronological order). NOT a promise - losing streaks arrive in a different order in real life. A unit = 1 micro on each market (MNQ+MES+MYM); each market stops adding size at ITS OWN measured cap. Margin ~\$200/unit intraday - the policy binds long before the broker does. Rails scale with size: daily breaker = \$1,000 x units. Demo first. Live on your word.
Session: 13:30-20:00 UTC (US cash hours) - the only window the edge is validated in.
